

Business Data Services - Interconnect (BDS-I) : Wireless Backhaul

CDG's BDS-I has everything you need to effectively and accurately bill wireless backhaul. Major ILECs, CLECs, and broadband providers are already utilizing our system to tap into this more than \$20 billion dollar industry. With our wealth of support and knowledge in handling special, dedicated access and more than 12 years of experience in billing for Wholesale services, we can help you maximize your wireless backhaul billing revenues.

Wireless backhaul is an integral part of the cellular network and a more than \$20 billion industry that will continue to rise as the demand for high speed wireless access and data transport increases and 5G buildout commences. Providing and billing wireless backhaul is an opportunity for almost anyone to increase their revenue streams, from traditional ILECs to CLEC wholesalers and broadband providers. Of course, having the infrastructure to provide wireless backhaul services is just one of the key components to tapping this market. You also need to be able to define the rating structures and discount plans, maintain the necessary contracts, and produce the necessary records in order to bill it properly.

Most companies with the capacity to provide wireless backhaul services are limited either because they can only create non-mechanized bills that can't be verified or audited or because their current system cannot provide the rating flexibility and CRM capabilities needed to secure contracts with carriers. CDG's mechanized BDS-I billing system solves all these issues, allowing you the ability to create multiple rating structures, develop flexible discount plans, set up carrier contracts, and produce industry-standard bills. We are already providing wireless backhaul billing services for several major telecommunications companies. Contact us to find out how BDS-I can help you maximize your wireless backhaul billing revenues.
